

## Enhancement one: Single Line Font

Solid Edge made a great addition of the etch command. To enhance this I would like to see solid edge with a single line font capability. SolidWorks implemented this in their 2014 version. A single line font cuts the etch time in half on a laser and creates less entities that the CAM software has to read in order to make code. I believe this would also help those with mills and lathes.

Enhancement two: Explode text or vectorized text in draft

Sometimes with a simple part there is no need to go full 3D. Drawing and creating a file for CAM in 2D is good enough. The only problem is when you need to add text for part identification that needs to be etched or engraved into the part. The draft module does not offer a vectorized text option. 2 ways that could solve this is if you can place text in the draft then explode the text like you can in AutoCAD or DraftSight. Another option would be to have the ability to type text that is already vectorized.
